Cases Requiring Attention

test_2_0000_0000 — ESCALATE (98% confidence)

Change: The land transformed from an undeveloped, sparsely wooded area with bare soil and scattered trees into a residential subdivision featuring multiple new houses, paved roads, driveways, and landscaped lots.

Environmental notes: Significant vegetation and tree cover was clearly lost, with natural scrubland and woodland converted to a residential subdivision featuring multiple homes, roads, and paved surfaces. This represents a near-complete transformation of undeveloped land to hardened urban surfaces, though this is a rough visual estimate based on satellite imagery alone.

Reason: A major unauthorized residential subdivision has been constructed with no permit of any kind on file, representing large-scale illegal development requiring immediate escalation.

test_102_0512_0000 — FLAG_FOR_REVIEW (72% confidence)

Change: A large commercial/industrial warehouse or distribution building was constructed on the previously vacant, undeveloped land. The development also includes a substantial parking lot, access roads, and associated infrastructure surrounding the building.

Environmental notes: The before image shows largely bare/scrubby undeveloped land with minimal vegetation, which has been converted to a large warehouse building with extensive parking and pavement in the after image; vegetation loss appears minimal given the already sparse cover, but significant soil sealing and impervious surface creation has occurred. This is a rough visual estimate based on satellite imagery alone.

Reason: A new construction permit application is on file for commercial use on this parcel, which aligns with the detected warehouse development, but the permit status is still pending with no issue date, meaning construction has begun without an approved permit.

test_2_0000_0512 — ESCALATE (99% confidence)

Change: The area was completely transformed from a natural landscape with a winding dry riverbed/sandy wash surrounded by trees into a residential subdivision with multiple houses, paved roads, driveways, and landscaped lots.

Environmental notes: Significant vegetation and tree cover was lost, with natural undeveloped land featuring a sandy riverbed/wash and surrounding forest converted to a residential subdivision with roads, rooftops, and paved surfaces. This represents a near-complete transformation of a natural landscape to hardened urban infrastructure, though this is a rough visual estimate based on satellite imagery alone.

Reason: A major transformation of natural land into a full residential subdivision with roads, houses, and infrastructure has occurred with absolutely no permit on file, representing a severe unauthorized development requiring immediate escalation.

test_121_0768_0256 — ESCALATE (82% confidence)

Change: The previously undeveloped/rural land with a simple road intersection has been transformed into a large-scale development featuring multiple buildings, parking lots, paved roads, and what appears to be a residential or mixed-use complex with several structures of varying sizes.

Environmental notes: Significant vegetation and scrubland were cleared to construct multiple buildings, parking lots, and paved roadways, representing a substantial conversion of natural land to impervious

surfaces. This is a rough visual estimate, but the loss of natural cover appears extensive across most of the parcel.

Reason: A large-scale development with multiple buildings and infrastructure has been constructed on previously undeveloped land, but the only permit on file is a pending (not approved) building *extension* permit, which does not authorize new large-scale ground-up construction, making this high-severity unauthorized development requiring urgent escalation.
